MTAC 138 (eInduction)
10/10/2012

Agenda:

- Discuss Enhancements for October Release

Key Discussion Points:

- Cancel meeting for October 24
- October Enhancements
    - Continuous Mailings
        - Mailers can go to the MID Management dashboard and identify MID as continuous mailing MID for eInduction
        - BMEUs will be able to approve continuous mailer identified MIDs
        - After approval, PO! MID profile data will be transmitted electronically to SV
        - Continuous Mailer Reconciliation Report will be generated in PostalOne! to track unpaid containers until they are paid
    - Mis-Shipped Invoicing
        - eInduction has always been designed to invoice for mis-shipped containers
        - What is changing for October – mailer will be able to identify user account to charge for mis-shipped invoices
    - eInduction Percentage Identification
        - eInduction reports will have a new column (eInduction Pallet %) that will show the percentage of the appointment that is eInduction
    - eInduction Indicator for Sibling Containers
        - Past: no physical sibling containers were sent to eInduction and no validations were performed
        - October: physical sibling containers will be processed when the logical container referenced in the eDoc is set to yes for eInduction
    - eInduction will support mixed mailing in Mail.XML
    - eInduction system will be configurable to allow pre-induction errors to be converted to warnings and warnings converted to errors
        - This ensures that the eInduction process does not completely fail when an error occurs
    - New validation rule for container message set to only have less than or equal to the number of pallets that are on the postage statement
    - New MicroStrategy eInduction Duplicate Barcode Scan Report
- Plan to go to DVD on November 12 for several weeks to pilot eInduction

Questions/Comments:

- Question: I'm going to submit a MID for every plant in my operation (same MID). I don't know what CRID it's tied to (CRID) may be shut down.
    - Jesse: For all practical purposes, it's the MID that is pushed down to the SV.
- Question: Are we talking about the MID in the pallet barcode or the MID where you identify yourself as the mail preparer?

- o Jesse: The MID in the pallet barcode.
- Question:
  - o Scenario 1: If I send over a container ID to a postage statement ID (with 20 paid containers), once I hit the 21st container on the statement ID, will I get an error?
    - Shariq: Yes
  - o Scenario 2: Customer pays postage in PO! and sends to consolidator with no IMcb. Consolidator labels with IMcb and submits to an existing Postage Statement with 20 pallets attached to it.
    - Shariq to verify
  - o Scenario 3: Customer sent IMcbs and paid postage, but didn't mark EIN flag. Consolidator overlabels with a new IMcb, but uses same Postage Statement ID. It will look like I'm adding a 21st pallet to the postage statement.
    - Validation is to make sure no more than the allotted number of pallets come in on an appointment
    - Shariq to verify

Action Items:

- Phil to create a ticket for performance improvement (container manifest report upload is very slow)
- Shariq to test/verify validation rule for container message set to only have less than or equal to the number of pallets that are on the postage statement
  - o What happens if the consolidator is the first to create IMcbs and link to existing postage statement?
  - o What happens if the customer sent containers with IMcbs but didn't mark EIN flag, and then the consolidator overlabels with new IMcbs (and uses the same postage statement)?
